Import { Component } from '@angular/core'; import { FormBuilder, FormGroup } from '@angular/forms'; @Component({selector: 'my-app', templateUrl: './app.component.html', styleUrls: ['./app.component.css']}) export AppComponent class {Form: FormGroup Orderdata = []; Manufacturer (Private FormBuilder: FormBuilder) {this.Form = this.FormBuilder.group({order: []}); submit() { ... This scenario is generally managed with a list of checkboxes. A scenario Reale these data would probably be from an API. In this post, we will build a list of control boxes with angular but we will dynamically create it from a list and we will add some additional validation rules. The operator of () will emetate a single event value For us. Submit In our model, we associate our form A [FORMGROUP] = "FORM " null).filter (v => v! = null); console.log (selectorderids); } } In our example a cycle is performed in each order and a new FormControl instance is created. Later, we will add the personalized validation to our list of checkboxes. The module array deals with each checkbox as part of a set of controls. If we look at our model, we can see our validation at work. Discover the complete demo example in the link below! Subsequently the refactoring of the example will be performed to manage asynchronous form controls. null: {mandatory: true}; }; Return Validator; } In our module we spend a second parameter to our Formarray, the MINSELECTEDCHECKBOXES function. For our example, we will use all Classes. A common user interface template for the application has a set of elements where the user must select too many elements. Here's how it will be our user interface: For our use case, we have a list of orders for a user choose from. Next, in the TypeScript, we need to write a validator function. We are almost done but remember earlier we said there would need to be some validation. Reactive Forms compose of primarily three Class types. import { Component } from '@angular/core'; import { FormBuilder, FormGroup, FormArray, FormControl, ValidatorFn } from '@angular/forms'; import { of } from 'rxjs'; @Component({ selector: 'my-app', templateUrl: './app.component.html', styleUrls: ['./app.component.css']}) export class AppComponent { form: FormGroup; ordersData = []; get ordersFormArray() { return this.form.controls.orders as FormArray; } constructor(private FormBuilder: FormBuilder) { this.form = this.FormBuilder.group({ orders: new FormArray([], minSelectedCheckboxes(1)) }); this.ordersData = this.addCheckboxes(); } private addCheckboxes() { this.ordersData.forEach(i => this.ordersFormArray.push(new FormControl(false))); } getOrders() { return [{ id: 100, name: 'order 1' }, { id: 200, name: 'order 2' }, { id: 300, name: 'order 3' }, { id: 400, name: 'order 4' }]; } submit() { const selectedOrderIds = this.form.value.orders.map(v, i) => v ? First FormGroup which typically represents a single form. A FormControl usually represents a single input in a form. This enables us to have a flexible validator that can validate to say a minimum of two or three checkboxes. Our validation rules stated the user must check at least one item before being able to submit the form. A FormGroup is typically made of many FormControl. On each checkbox, we give it a control name which in this example is just the index of the loop. We subscribe to the value and then pass the orders back into our addCheckboxes just like before. The minSelectedCheckboxes function is our validator that will check that at least n checkboxes are selected. We can now simulate an async request for our orders by using the RxJS operator of(). import { Component } @ Angular / Core' import { FormBuilder, FormGroup, FormArray, FormControl, ValidatorFn } from '@ Angular / Forms'; @ Component ({Selector: "My-App", Templateurl: './App.COMONENT.HTML', Styleurls: ['./app.component.css']}) export class AppComponent {module: formgroups; Date = [{ID: 100,Name: 'Order 1'}, {ID: 200,Name: 'Order 2'}, {ID: 300,Name: 'Order 3'}, {ID: 400,Name: ' order 4 '}]}; Get Formarray orders () {return they.form.controls.ersorders as FormArray; } Builder (Private FormBuilder: FormBuilder) {this.form = this.formbuilder.group ({Orders: New FormArray ([])}; this.Addition (); } Private AddCeckCoxes () {This.IrdERSData.Foeach (i => This.ErderSformarray.push (new formontrol (false))); } Send () {CONST SelecudOrderIDS = This.Form.Value.ersorders.Map (checked, i) => selected? Const ordesData = [{ID: 1, name: 'order 1'}, {ID: 2, name : 'Order 2'}, {ID: 3, First name: 'Order 3'}, {ID: 4, First name: 'Order 4'}]; for our example, the subject of the orders will be It's pretty simple. Finally it was Formarray. To that, we use the API of reactive forms. First, we will have started by creating our formgrap in our typing and model for the component. Prev + Next: Prev, 0), returned totalized> = min? The API of reactive forms has some excellent advantages with the use of observables and reactive programming, but it also has an excellent natural way to declare form inputs in our diphthivestically. This.IrdERSData [I] id: NULL).Filter (V => V! = NULL); console.log (SelectOrderIDS)) } Export Class AppComponent {module: formgroups; orderDate = [...]; Manufacturer (Private FormBuilder: FormBuilder) {this.form = this.formbuilder.group ({Orders: New FormArray ([]) minSelectedCheckboxes (1)); this.Addition (i, j ...) MinIsocquestingCheckCoxes function (Min = 1) {Const Validator: ValidatorFn = (FORMARARRAY: FORMARRARY) => .Jovisseccus .Jovisseccus.verp(ecuder, .eulaV.lortnoC >= lortnoC(paM. slortnoC.YARRARAMROF = TCELESLATOT .I] Ot ecivres redliubmrof eht esu ew, tnenopmoc ruo ni} .edoc tpircsepyt eht htiw etacinummoc otalav mrof ewt gol liw eheulav mroph eht gol liw eTaLav mrof eht gol liw eTaLav Mrof EMBUSGN EHT NO .ETALPMET EHT OT YARRAMROF Sredro EHT PU ERIW T DEEN EW, TXEN .DILAVNI SI Mrf EHT FI NOTTUB MROF EHT ELBASIT ELGNIS A TSEEL TA TAST ETALPMET EHT TA KOL A EKAT S 'Tel noitadilav xobkcehc .rofgn * HTIw Revo Etareti Ew Taht xobkcehc a denifed ew, etalpmet ruo ni> Mrof / Nottub / Nottub Lebal /
